

Copy Paste

Contents

- Metadata

This notebook covers how to load a document object from something you just want to copy and paste. In this case, you don't even need to use a DocumentLoader, but rather can just construct the Document directly.

```
from langchain.docstore.document import Document
```

```
text = "..... put the text you copy pasted here....."
```

```
doc = Document(page_content=text)
```

Metadata

If you want to add metadata about the where you got this piece of text, you easily can with the metadata key.

```
metadata = {"source": "internet", "date": "Friday"}
```

```
doc = Document(page_content=text, metadata=metadata)
```
