ReadTheDocs Documentation

This notebook covers how to load content from html that was generated as part of a Read-The-Docs build.

For an example of this in the wild, see here.

This assumes that the html has already been scraped into a folder. This can be done by uncommenting and running the following command

```
#!wget -r -A.html -P rtdocs https://langchain.readthedocs.io/en/latest/
```

```python
from langchain.document_loaders import ReadTheDocsLoader
```

```python
loader = ReadTheDocsLoader("rtdocs")
```

```python
docs = loader.load()
```
