# Bash

It can often be useful to have an LLM generate bash commands, and then run them. A common use case for this is letting the LLM interact with your local file system. We provide an easy util to execute bash commands.

```python
from langchain.utilities import BashProcess
```

```python
bash = BashProcess()
```

```python
print(bash.run("ls"))
```

```
bash.ipynb
google_search.ipynb
python.ipynb
requests.ipynb
serpapi.ipynb
```
